Can you suggest a good 1 year old piano/keyboard under \$500.00? I would like something which works with PC music software like puredata and cradlespeed, but they don't all work together so it doesn't make sense to buy a digital piano, a digital keyboard, and a standalone music sequencer (I'm only new to Mac so that is why I am asking). I'm an amateur so I'd rather not spend a lot, and I don't have much room for it. Anyone have any recommendations? P.S. I found a good keyboard for \$275 at Musikexpress. I'm tempted to get that. But I'd rather not spend that much and not know that it will work with Mac OSX. I'm hoping a simple keyboard will work. have to click twice to see the paste clipboard contents. I had to toggle my browser to remember the clipboard. *sigh* Thank you everyone. * * *

I'm also curious, why there is no .NET Provider for the COM-based Excel interop as well. Question: Are there any .NET Providers for Excel out there? A: .NET Interop for Excel does not exist because it isn't possible to build a .NET Interop component for COM objects in general (and Excel objects in particular). .NET's COM Interop support is tightly tied to unmanaged COM objects and therefore can only work with natively supported COM types. The .NET Runtime can't handle supporting and marshaling COM objects in general. .NET's COM support was not meant to be used by the .NET Framework itself and its underlying CLR. It was designed to be used by managed applications to create COM objects and then work with them from within the .NET Framework. Thus, all types from the `xll.net` namespace are .NET COM objects and can therefore only be used in .NET applications. .NET Interop for Excel is only for backwards compatibility. The .NET Framework does not support using managed objects in general and Excel objects in particular. THE first and only podcast by the legendary Captain Planet.
